

test-automator

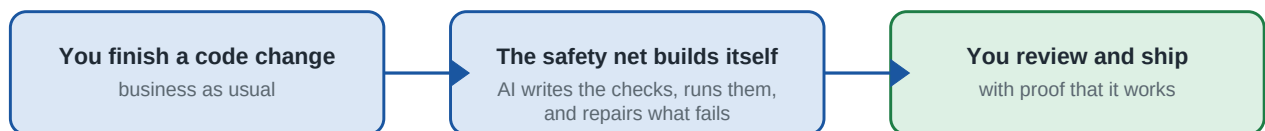

A safety net for every code change — built automatically

Every software team knows this loop — whether you write code or fund it:

Tests are the safety net that breaks this loop. They're skipped not because teams don't care, but because writing them by hand is slow, repetitive work that always loses to the deadline.

test-automator removes that trade-off. It's an open-source tool that builds the safety net automatically, for exactly what changed:

Nothing reaches you until it has been written, executed, and repaired — and nothing ships until you approve it.

It works with **Python, Kotlin, and Java**, and runs on the AI tools your team already pays for — Claude Code, GitHub Copilot, or Gemini. No new budget line, no per-use costs.
